Double-stranded cDNA was ligated to EcoRI adaptors, 5 cycles of PCR applied to the cDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pAMP10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by David Krizman."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          with a modified polylliker; plasmid DNA from the normalized library NCI_CGAP_Pr22 was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 985608-986799, 1101192-1101559, and 1217928-1220615). Subtraction by Benoto Soares and M. Fatima Bonaldo. " a 121 c 107 g 103 t

Solisclosure; Fig 7: 165pp; English.

This is the amino acid sequence of an O antigen flippase encoded

by the wzx gene of a gene cluster (see X06748) involved in the

biosynthesis of the Escherichia coli Oll1 O antigen. The protein

chas 12 transmembrane segments and has similarity in secondary

ctructure to other wzx gene products. The use of nucleic acid

molecules derived from particular assembly and transport genes,

particularly wbd (transferase), wzx (flippase) and wzy (polymerase)

genes, within O antigen gene clusters improves the specificity of

methods for the detection and identification of O antigens, e.g. in

testing food- or faecal-derived samples, or samples from patients.

The O antigen is a major virulence factor of enteropathogenic E.

coli strains that cause diarrhoea and haemorrhagic colitis.
                                                                                                                                                                                                                                                                                                                                          Align seg 1/1 to: W88307 from: 1

Human cholinesterase-type proteins can be used for the prophylaxis or for the treatment of the effects of organophosphorous cpd. poisoning. Other uses include clinical detection of pseudocholinesterase deficiencies, elucidation of the active site topography and the AA sequence of ACRE for the development of rapid simple clinical methods to detect poisoning or disease-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      27-JUN-1991 (first entry) Sequence of protein having human cholinesterase (ChE) activity in clone FBChE12a.

A CDNA library prepared from foetal brain mRNA was screened with degenerate probe pools based on the organophosphorus binding site cholinesterases. A 764 nucleotide insert (designated FBChEl2) was isolated from one positive clone and sequenced. This insert, containing an ORF large enough to code for about half the subunit size of human cholinesterase, was used as a probe to obtain the full ength pseudocholinesterase sequence. See also 042496.

Claim 4; Columns 41-46; 34pp; English.
A cDNA library prepared from foetal brain mRNA was screened with
degenerate probe pools based on the organophosphorus binding site of
cholinesterases. A 764 nucleotide insert (designated FBChE12) was
isolated from one positive clone and sequenced. This insert (Q42495),
containing an ORF large enough to code for about half the subunit
size of human cholinesterase, was used as a probe to obtain the full-
length pseudocholinesterase sequence by screening a foetal liver
cDNA library and a primary glioblastoma cDNA library (Q48393).
This sequence differs from sequence Q42496, particularly in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               01-JUN-1993.

C Laim 1; Fig 8; 163pp; French.

C Laim 1; Fig 8; 163pp; French.

C VanH is coded for by a 7.3kb Hindill-EcoRI fragment of the plasmid plassid. (The plasmid contains resistance genes from Enterococcus faecium BM 4147 and was described in New England J.

C Med., 319:157-161). The VanH protein has a mol. mass of 35,754 and that similarities to dehydrogenases which catalyse NAD+ dependent coxidation of 2-hydroxycarboxylic acids. VanH interacts with VanA, a D-Alanine:D-Alanine ligase. Resistance to glycopeptides is thought to involve the blosynthesis of a new component by VanA; the new peptide can be incorporated with peptidoglycans but is not recognised by vancomycin. See also Q25178-Q25183.

This sequence represents a human secreted protein, and is CC expressed in foetal liver, spleen and pituitary gland and to a CC lesser extent in multiple tissues.

CC conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a cC sample or by determining the presence of mutations in the DNA sequences. Specific uses are described for each of the DNA sequences and the encoded include developing products for the diagnosis or treatment of cancer, tumours, neurological disorders, developmental abnormalities and foetal cegnitive disorders, blood disorders, leukaemias, diseases of the immune system cC conditional and alergies or asthma), hepatic disease, Alzheimer's and cC cognitive disorders, schizophrenia, prostate diseases, autoimmune cC disorders and AIDS. The polypeptides are also useful for identifying their binding partners.

Polypeptides involved in expression of glycopeptide antibiotic resistance - useful in diagnosing presence of Gram-positive enterococcal strains e.g. Enterococcus faecium and E gallinarum Disclosure; Fig 5; 163pp; French.

A 7.3kb fragment of E.faecium DNA containing the five genes vanH, vanA, vanX, vanR and vanS involved in antibiotic resistance was translated in each of the three possible open reading frames. Within ORF 3 were the vanH and vanX genes. The "X"s in the sequence indicate the position of nonsense codons.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         N-PSDB; 094172.
New nucleic acid encoding a Y4-Receptor, New nucleic acid for treating amnesia, i
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence represents a rat neuropeptide Y/peptide YY/pncretic polypeptide (Y4) receptor, which can be used to screen drugs which bind to it, specifically to find ligands (agonists or antagonists) which bind to it. The ligands can be used to treat abnormalities, specifically the antagonists can be used to treat amnesia, feeding disorders, epilepsy, hypertension, sleeping disorders or pain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bard JA, Branchek T, Walker MW, WPI; 95-246190/32.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   09-DEC-1995 (first entry)
Neuropeptide Y/peptide YY/pancretic polypeptide receptor (Y4).
Y4 receptor; hp25a neuropeptide receptor; antisense oligonucleotide;
                                                                                                             109

resistance - potentially useful as cyto-protectant and target for
reversing drug resistance in cancer cells

Claim 4; Page 33-36; 57pp; English.

The amino acid sequence (W00215) of a C-terminal portion of a
membrane-associated serine-threonine protein kinase, designated
pKR, was deduced from a cDNA clone (T33370) obtd. from MDR human
cell line KB-V1. The novel kinase has higher activity in several
CMDR cell lines than in sensitive parental cells. It is also
cexpressed at high activity in the brain. It may be important in
the pathway leading to MDR. Inhibition of the kinase may
therefore re-sensitise cells to chemotherapeutic drugs. Should
pKR have a role in stress control, then inhibition might lead to
cedath of resistant tumour cells. Variant PKR proteins can be
produced in which PKR amino acids are replaced by similarly
sequence 1160 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example: Fig 5: 62pp; English.

A mutant IR is claimed which may have a mutated alpha-chain, esp. at the precursor processing site. The beta-chain may be mutated, e.g. by deletion of the transmembrane sequence; the tyrosine kinase activity may be inactivated. Fig. 5 is a comparison of oncogene and human EGF receptor sequences with that of HIR in the cytoplasmic domain of the insulin receptor beta subunit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    27-AUG-1986.

The Crimothion provides Xenopus W667-16, W667-19 and WA628-5 polypetides (see W98634-36), isolated DNA molecules (see X06998-700), vectors, conditions are used: to modulate regulation of pancreatic genes (e.g. for pancreatic tissue repair and for treatment or combinant protein production. Prazzled proteins are used: to modulate regulation of pancreatic clasue repair and for treatment or combinate cell development (particularly in haematopoletic gut, concluding inducing de novo formation of beta-1slet cells); to modulate cell development (particularly in haematopoletic gut, concluding inducing particularly for inducing cell formation, growth, conditate cell development (particularly for inducing cell formation, growth, condition of chondrocytes and/or cartilage tissue by treating progenitor cells in vitro; generally to modulate effect of wnt cents; to raise antibodies; and as dietary supplement or cell culture additive. They are also used: to treat diseases associated the activities, e.g. in wound healing; to treat or prevent rheumatoid arthritis, osteoarthritis or other articular cartilage disorders; in combination with transplants of cells for treating neuronal conditions and to induce formation of hormone-producing cells, in both human and veterinary medicine.

HTm4 is related to the FC(epsilon)RI receptor (FR). HTm4 contains four hydrophobic domains of 20-21 maino acids. The N-terminal region before the first hydrophobic domain contains four proline residues, and each of the hydrophilic regions between the hydrophobic regions contains one proline. This protein crosses the plasma membrane four times forming two small extracellular loops and has both the N- or C-terminals in the cytoplasm. The HTm4 gene and protein can be used in the research and study of the induction of expression of FR and the function of its subunits. They can be used in the design of drugs which can block or inhibit induction of FR, thereby treating atopic diseases such allergy, asthma, atopic dermatitis and allergic rhinitis. The HTm4 gene sequences may also be used to detect patients suffering thromesome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            US5552312-A.

This sequence is the HTm4 protein. The HTm4 protein is specifically bound by the antibody of the invention. HTm4 shows homology to the beta subunit of the high affinity IgE FC receptor (FcepsilonRibeta) and the CD20 antigen, both of which are in the 4-transmembrane spanning proteins superfamily (TM4SF). The antibody of the invention is used to block or mimic binding of ligands such as the tumour necrosis factor (TNF) receptor-associated factors TRAF-1, TRAF-2 and TRAF-3 and the phosphatase, CDK-activating kinase (KAP), to receptors comprising HTm4, and to detect haematopoletic cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HTm4 protein.

Direct Submission
Submitted (29-MAR-1999) Drosophila Genome Center, Lawrence Berkeley
Laboratory, MS 64-121, Berkeley, CA 94720, USA
On May 14, 1999 this sequence version replaced gi:4764154.
Por further information about this sequence, including its location
and relationship to other sequences, please visit our sequence
archive Web site (http://www.fruiffly.org/sequence/) or send email
to bdgp@fruitfly.berkeley.edu. All contigs in this submission meet
the following cutoffs: length >= 400 bases, phrap computed error

Sg

NOTE: This is a 'working draft' sequence. It currently consists of 21 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence. as soon as it is available and the accession number will be preserved. contig of 1042 bp in gap of unknown lengt contig of 725 bp in of 1042 bp in length length length
